

Dual, Low-Noise, High-PSRR, 150mA LDO without Bypass Capacitor

DESCRIPTION

The EUP7220 is a dual-channel low noise, low dropout. High PSRR, high accuracy CMOS voltage regulator. Performance features include low output noise, high ripple rejection ratio, low dropout and very fast turn-on times.

The EUP7220 is also fully compatible with low ESR ceramic capacitors, reducing cost and improving output stability. This high level of output stability is maintained even during frequent load fluctuations, due to the excellent transient response performance and high PSRR achieved across a broad range of frequencies.

The EN function allows the output of each regulator to be turned off independently, resulting in greatly reduced power consumption. The EUP7220 is available in small 1.6mm×1.6mm TDFN-6 and TSOT23-6 packages.

FEATURES

- 150mA Output Current (Per LDO)
- 30 μ V_{RMS} Low Noise Output
- 70dB PSRR at 1KHz
- Low 50 μ A Quiescent Current (Both LDOs active)
- 2.5V to 5.5V Input Voltage Range
- 190mV Dropout at 150mA Load
- Dual Shutdown pins Control Each Output
- Current Limiting and Thermal Protection
- Short Circuit Protection
- Available in TDFN-6 1.6mm×1.6mm and TSOT23-6 Packages
- RoHS Compliant and 100% Lead (Pb)-Free Halogen-Free

APPLICATIONS

- Cellular Phones
- Camera, Video Recorders
- PDAs
- Hand-held Equipment

Application Note

External Capacitors

Like any low-dropout regulator, the EUP7220 requires external capacitors for regulator stability. The EUP7220 is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

Input Capacitor

An input capacitance of $1\mu F$ or higher is required between the EUP7220 input pin and ground (the amount of the capacitance may be increased without limit). This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analog ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input. If a tantalum capacitor is used at the input, it must be guaranteed by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the ESR on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will be $1\mu F$ over the entire operating temperature range.

Output Capacitor

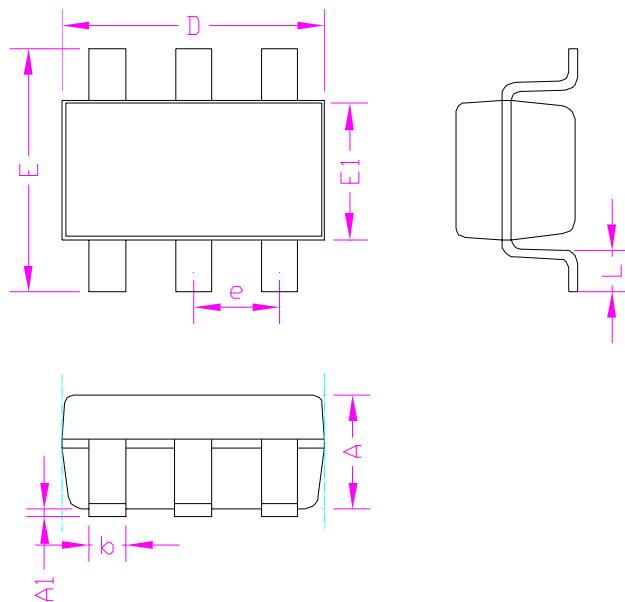

The EUP7220 is designed specifically to work with very small ceramic output capacitors. A ceramic capacitor (temperature characteristics X7R or X5R) in $1\mu F$ to $10\mu F$ range with $5m\Omega$ to $500m\Omega$ ESR range is suitable in the EUP7220 application circuit. The output capacitor must meet the requirement for minimum amount of capacitance to maintain good loop stability and phase margin.

No-Load Stability

The EUP7220 is stable without any external load. This is specially important for CMOS RAM keep-alive applications.

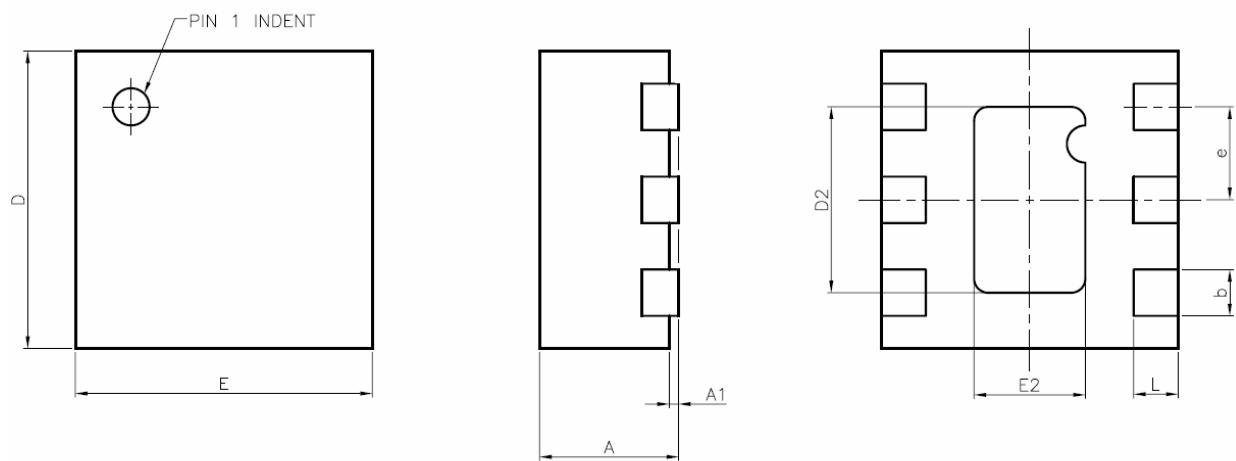

On/Off Input Operation

The EUP7220 is turned off by pulling the EN pin low, and turned on by pulling it high. If this pin is floating, the regulator is uncertain. To assure proper operation, the signal source used to drive the EN input must be able to swing above and below the specified turn-on/off voltage thresholds listed in the Electrical Characteristics. When EN is logic low, output is internally discharged to GND through a 500Ω resistor.
