

# 600mA High PSRR Low Dropout Linear Regulator

## DESCRIPTION

The EUP7907 is a high current, low dropout linear regulator with fast transient response and high PSRR. It offers high output accuracy, extremely low dropout voltage, low quiescent current and fast start-up time.

The EUP7907 is designed to work with low-ESR ceramic capacitor, reducing the amount of the PCB area necessary for power applications. Only a 2.2uF ceramic capacitor can make the device stable over the whole load range.

The EUP7907 monitors the input voltage for power on reset to ensure the regulator is disabled when the input voltage is not high enough for normal operation. When EUP7907 detects fault signal, such as over-temperature, it will turn off the pass transistor and discharge VOUT to GND from the internal resistor.

The EUP7907 has two modes of operation. When the FB pin is connected to ground, its output is a pre-set value: 0.8V~3.6V. There is no external component needed to decide the output voltage. When the version of EUP7907 with fixed voltage higher than 1.5V is selected and its FB pin is connected to two external resistors divider, its output can be adjusted from 0.8V to 5V. Other key features include over-current protection, thermal shutdown. The device can be available in the TDFN-8 package or SOT23-5 package.

## FEATURES

- 2.5V to 5.5V Input Voltage Range
- 300mV@600mA Dropout Voltage
- Excellent Transient Response
- Stable with 2.2uF Ceramic Output Capacitor
- 70dB PSRR at 1kHz
- Low 120uA Quiescent Current
- Low Shutdown Current:<1uA
- Output Current Limit
- Output Voltage With High Accuracy:  
2% Initial Accuracy  
Fixed Output Voltage: 0.8V ~ 3.6V  
Adjustable Output Voltage: 0.8V to 5V
- Thermal Shutdown
- COUT Auto-Discharge when Shutdown
- RoHS Compliant and 100% Lead (Pb)-Free

## APPLICATIONS

- Cellular Phones
- Bluetooth portable radios and Accessories
- battery-Powered Equipment
- Laptop, Palmtops, Notebook Computer

## Pin Configurations

Package Type	Pin Configurations	Package Type	Pin Configurations
SOT23-5		TDFN-8	<p>TOP VIEW</p>

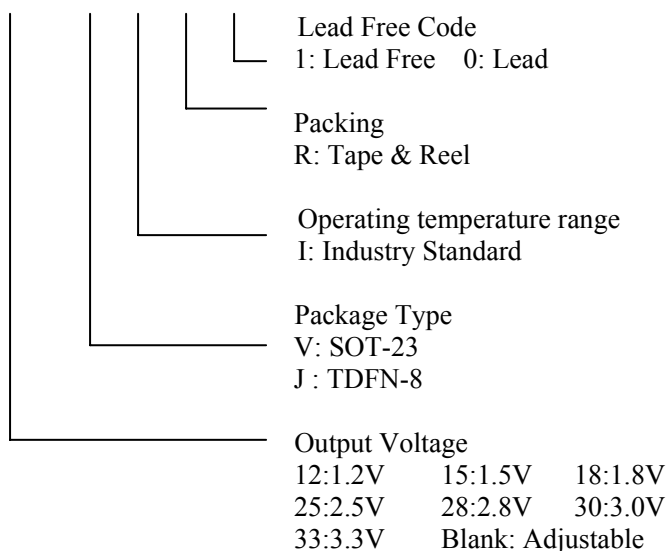

## Pin Description

PIN	SOT23-5	TDFN-8	DESCRIPTION
VIN	1	1,2	Input Voltage of the LDO.
GND	2	6	Signal Ground.
EN	3	8	Enable Pin. Connect this pin to ground or less than 0.4V to disable the device. Active-high for EUP7907.
FB	4	5	Feedback pin. This pin is the anode terminal of the error amplifier. The FB pin compares with internal reference voltage to regulate the output voltage. Connect to GND for fixed output voltage version.
VOUT	5	3,4	Output voltage of the LDO.
NC	--	7	Not connected.

Note 1: Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2: Dropout is defined as  $V_{IN}-V_{OUT}$  when  $V_{OUT}$  is 100mV below the value of  $V_{OUT}$  for  $V_{IN}=V_{OUT}+0.5\text{V}$ .

Note 3: Test time needed for  $V_{OUT}$  to reach 90% of final value

## Function Description

The EUP7907 is a high output current, low dropout linear regulator with fast transient response and high PSRR. It offers high output accuracy, extremely low dropout voltage, low quiescent current and fast start-up time. It is designed to work with low-ESR ceramic capacitor, reducing the amount of the PCB area. Only a 2.2uF ceramic capacitor can make the device stable over the whole load range.

As shown in the function block diagram, the EUP7907 is composed of the bandgap reference voltage, the error amplifier, P-channel MOSFET pass transistor, internal resistor divider and some additional protection circuits. The reference voltage, connected to the cathode terminal of the error amplifier, compares with the feedback voltage to regulate the output voltage to make it constant over the whole load range. If the feedback voltage is lower than the reference voltage, the pass transistor gate is pulled low to increase its conductivity. This allows more current to flow to the output and increases the output voltage. If the feedback voltage is higher than the reference voltage, the pass transistor allows less current to flow to the output. The feedback point is the output of the internal or external resistor divider connected to the VOUT pin.

### Supply Input Power on Reset

The input voltage supplies current to the output and the operation voltage of the internal circuit. The input voltage is monitored for power on reset (POR) to ensure the regulator is disabled when the input voltage is not high enough for normal operation. The POR threshold voltage is 2.1V at VIN rising typically.

### Enable/Shutdown

The EUP7907 is disabled when the EN pin is connected to ground or the voltage less than 0.4V, reducing the quiescent current to less than 1uA. In the shutdown mode the error amplifier, the reference voltage, the driver and the pass transistor are all disabled. Make this pin higher than 1.5V to enable the device.

### Soft Stop

When the regulator is disabled, an internal 400Ω resistor is connected between V<sub>OUT</sub> and GND. This is intended to discharge C<sub>OUT</sub>. The internal resistor is not used when the device turns on.

### Adjustable Output Voltage

EUP7907 has a wide output voltage range. The output voltage is programmed using an external resistor divider as shown in Figure 4. The output voltage can be calculated by the following equation:

$$V_{OUT} = \left(1 + \frac{R_1}{R_2}\right) \times V_{REF} \quad (\text{EQ. 1})$$

where V<sub>REF</sub> is the internal reference voltage, which is 0.8V in EUP7907.

Figure 4. Output Voltage Select Circuit

### Current Limit

The EUP7907 includes a current limit circuit to monitor the gate voltage of the pass transistor to limit the output current. When the output current is higher than the over-current limit, the circuit will clamp the gate voltage of the pass transistor to keep the current flowing to the output. The typical value is 0.9A.

### Thermal Shutdown

The EUP7907 monitor its temperature automatically. When the operation junction temperature exceeds 170 °C, the OTP circuit starts the thermal shutdown function to turn the pass transistor off until it cooled down by 30 °C then the pass transistor turned on again. For continue operation, do not exceed absolute maximum operation junction temperature. The circuit is a non-latched protection.

## Application Information

### Resistors Select

Choose R<sub>2</sub>=100k to optimize accuracy, power supply rejection, noise and power consumption. And the R<sub>1</sub> can be chosen by:

$$R_1 = R_2 \left( \frac{V_{OUT}}{V_{REF}} - 1 \right) \quad (\text{EQ. 2})$$

where V<sub>REF</sub> is the internal reference voltage, which is 0.8V in EUP7907.

### External Capacitor

Like other low-dropout regulator, the EUP7907 requires external capacitors for stability. It is specifically designed for low-ESR capacitors requiring minimum PCB area and smallest components.

## Input Capacitor

A 2.2uF capacitor is required between the VIN pin and the GND pin. Place it as close as possible to the device. There are no requirements for the ESR on the input capacitor, but the tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will be 2.2uF over the whole operating temperature range.

## Output Capacitor

The EUP7907 is designed specifically to work with very small ceramic output capacitors. A 2.2uF to 10uF with 5mΩ to 500mΩ ESR range is suitable in the EUP7907 application circuit. The ESR of a typical 2.2uF ceramic capacitor is about 20mΩ, which easily meets the ESR requirement for stability.

## Capacitor Characteristics

More consideration should be taken when selecting the capacitor because its capacitance can vary with temperature. The capacitor type X7R or X5R, which operates over a temperature range of -40 to +85, will only vary within ±15%. Some large value ceramic capacitors are manufactured with Z5U or T5V temperature characteristics. Their capacitance can drop by more than 50% as the temperature goes from 25 to 85. Therefore the capacitor type X7R or X5R is recommended in applications where the ambient temperature will change significantly above or below 25.

## No Load Stability

The EUP7907 will remain stable and in regulation with no external load. This is special important in CMOS RAM keep-alive applications.

## Thermal Considerations

Thermal protection limits power dissipation in EUP7907. When the operation junction temperature exceeds 170°C, the OTP circuit starts the thermal shutdown function and turns the pass element off. The pass element turns on again after the junction temperature cools by 30°C.

For continuous operation, do not exceed absolute maximum operation junction temperature 125°C. The power dissipation definition in device is:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_Q \quad (EQ.3)$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient. The maximum power dissipation can be calculated by following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA} \quad (EQ.4)$$

Where  $T_{J(MAX)}$  is the maximum operation junction temperature 125°C,  $T_A$  is the ambient temperature and the  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating conditions specification of EUP7907, where  $T_{J(MAX)}$  is the maximum junction temperature of the die (125°C) and  $T_A$  is the operated ambient temperature. The junction to ambient thermal resistance  $\theta_{JA}$  is layout dependent. For SOT-23-5 package, the thermal resistance  $\theta_{JA}$  is 205°C/W on the standard thermal test board. For TDFN-8 package, the thermal resistance  $\theta_{JA}$  is 72°C/W on the standard thermal test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated by following formula :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / 205 = 0.488\text{W} \quad (EQ.5)$$

for SOT23-5 package

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / 72 = 1.388\text{W} \quad (EQ.6)$$

for TDFN-8 package

The maximum power dissipation depends on operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance  $\theta_{JA}$ . For EUP7907 packages, the Figure 5 of derating curves allows the designer to see the effect of rising ambient temperature on the maximum power allowed.

**Figure 5. Power Dissipation for EUP7907 Packages**

The EUP7907 is available in two standard packages: TDFN-8 and SOT23-5 packages.
