

PWM Control 2A Step-Down Converter

❖ GENERAL DESCRIPTION

AX3162/A consists of step-down switching regulator with PWM control. These device include a reference voltage source, oscillation circuit, error amplifier, internal PMOS and etc.

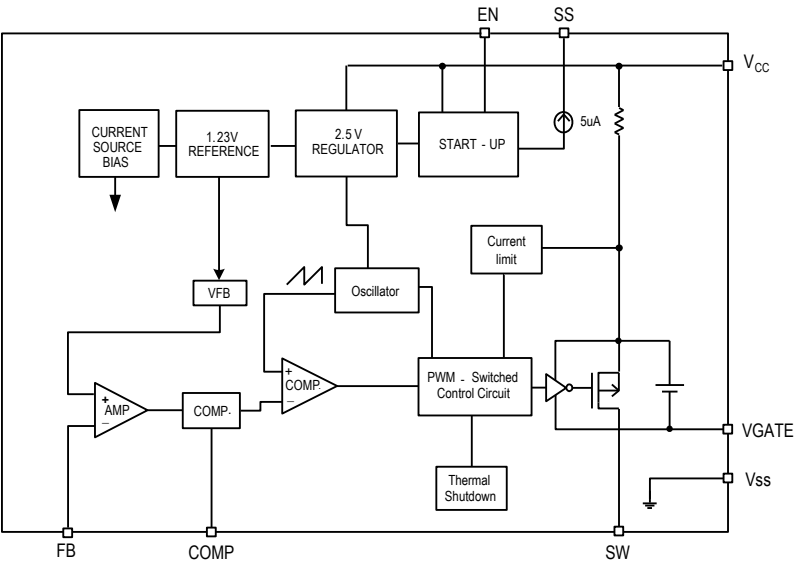

AX3162/A provides low-ripple power, high efficiency, and excellent transient characteristics. The PWM control circuit is able to the duty ratio linearly form 0 up to 100%. This converter is build out soft start function that prevents overshoot and inrush current at startup. An over current protect function and short circuit protect function are built inside, and when OCP or SCP happens, the operation frequency will be reduced. An external compensation is easily to system stable; the low ESR output capacitor can be used.

With the addition of an internal P-channel Power MOS, a coil, capacitors, and a diode connected externally, these ICs can function as step-down switching regulators. They serve as ideal power supply units for portable devices when coupled with the SOP-8L with exposed pad package, providing such outstanding features as low current consumption. Since this converter can accommodate an input voltage up to 58V, it is also suitable for the operation via an AC adapter.

❖ FEATURES

- Input voltage : 11V to 58V
- Output voltage : 3.3V to 56V
- Duty ratio : 0% to 100% PWM control
- Enable and Soft-Start function
- Current Limit, Short Circuit Protect (SCP) and Thermal Shutdown protection
- Built-in internal SW P-channel MOS.
- RoHS and Halogen free compliance.

❖ PIN ASSIGNMENT

The package of AX3162/A is SOP-8L-EP; the pin assignment is given by:

Name		Description
EN	1	ON/OFF Shutdown pin
Vss	2	GND pin
VGATE	3	Driver GATE clamping pin. The pin must connect a 1uF capacitor to VCC
Vcc	4	IC power supply pin
SW	5	Switch pin. Connect external inductor and diode here.
FB	6	Feedback pin
COMP	7	Compensation pin
SS	8	Soft-start pin

❖ APPLICATION CIRCUIT

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R4}\right)$$

$V_{FB} = 1.0V$; $R4$ suggest $0.8K \sim 3K$

❖ FUNCTION DESCRIPTIONS

EN

This pin can be supplied shutdown function. It is inside pull high function. Allow the switching regulator circuit to be shutdown pulling this pin below a 0.8V threshold voltage.

SS

This pin can be supplied soft start function. The pin must be connected a capacitor to ground. There is a 10uA current to charge this capacitor, vary the different capacitor value to control soft start time.

COMP

Compensation pin. For EL output capacitor application, the COMP pin connects R2 and C9 to ground for all condition; please refer the compensation table.

❖ APPLICATION INFORMATION

Setting the Output Voltage

Application circuit item shows the basic application circuit with adjustable output version. The external resistor sets the output voltage according to the following equation:

$$V_{OUT} = 1.0V \times (1 + \frac{R1}{R4})$$

Table 1 Resistor select for output voltage setting

V _{OUT}	R4	R1
5V	1.5K	6K
3.3V	1.3K	3K

Inductor Selection

For most designs, the different frequency can be reducing the inductor value; The AX3162/A is suggested 33μH. Where is inductor Ripple Current. Large value inductors lower ripple current and small value inductors result in high ripple currents. Choose inductor ripple current approximately 20% of the maximum load current 2A, Δ_L=0.4A. The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation (2A+0.2A).

Input Capacitor Selection

This capacitor should be located close to the IC using short leads and the voltage rating should be approximately 1.5 times the maximum input voltage. The RMS current rating requirement for the input capacitor of a buck regulator is approximately 1/2 the DC load current. A low ESR input capacitor sized for maximum RMS current must be used. A 470μF low ESR capacitor for most applications is sufficient.

Output Capacitor Selection

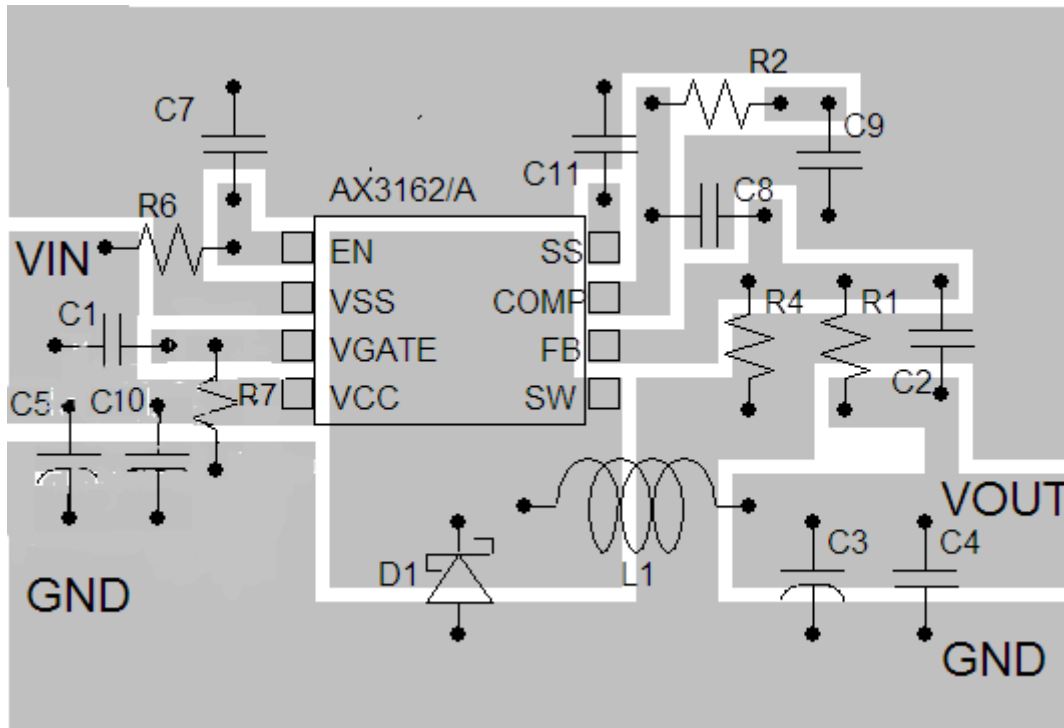

The output capacitor is required to filter the output and provide regulator loop stability. The important capacitor parameters are; the 100 KHz Equivalent Series Resistance (ESR), the RMS ripples current rating, voltage rating, and capacitance value. For the output capacitor, the ESR value is the most important parameter. The ESR can be calculated from the following formula.

$$V_{RIPPLE} = \Delta I_L \times ESR = 0.4A \times 80m\Omega = 32mV$$

An aluminum electrolytic capacitor's ESR value is related to the capacitance and its

voltage rating. In most case, higher voltage electrolytic capacitors have lower ESR values. Most of the time, capacitors with much higher voltage ratings may be needed to provide the low ESR values required for low output ripple voltage. It is recommended to replace this low ESR capacitor by using a 470 μ F low ESR values < 80m Ω .

PCB Layout Recommendations

1. Connect the C5 & C10 VIN bypass capacitor next to the VCC pin with a short return to the VSS pin.
2. Keep the VGAE to VCC bypass capacitor C1 near both pins as it provides the internal P-channel MOSFET gate driver.
3. Keep the SW traces as short as is practically possible as these carry high peak currents to decrease the EMI issue.
4. Carefully connect the noise sensitive signals such as FB, COMP as close to the IC as practically possible.
